SUBJECT: Palos Verdes Drilling / Residual Consciousness

PROSPECTIVE HERALD SUBMISSION

Palos Verdes: Occupancy, Drilling, and Residual Consciousness

Submitted for consideration by The Herald.

The Institute has been monitoring a large drilling effort on the north side of the Palos Verdes Peninsula. The public explanation - groundwater control and slope stabilization - is plausible and consistent with the area's well-known landslide problems.

The geometry is more difficult to explain. A number of long horizontal borings appear to favor paths beneath developed areas and, where routing permits, beneath multiple occupied structures.

Recovered terminology from associated correspondence refers to persistent human-field energy, accumulated occupancy, and extraction without direct contact. We cannot independently validate those phrases as technical descriptions.

The Church has long treated residual consciousness as a possible consequence of imperfect separation under the Veil. If occupancy leaves a persistent field, the drilling geometry may be designed to collect or concentrate it.

A more troubling possibility is that the project is not harvesting a pre-existing Nodal condition but attempting to manufacture one by forcing many occupied structures into a common subsurface geometry.

The crews are still drilling. The Institute has not interfered. For now, the shape of the work is more informative than the stated purpose.

Respectfully,
Howard Stonecipher
Director
